International Activities in Food Composition

Barbara Burlingame, PhD
FAO & INFOODS
Outline

• International agencies
• Critical issues
  – Double burden of malnutrition
  – Biodiversity
  – Trade
  – Risk assessment
• The future
Food composition activities fall within Article 1.1 of FAO’s constitution

“The Organization shall collect, analyse, interpret and disseminate information relating to nutrition, food and agriculture.”
1949-1982
INFOODS

• Started by UNU in 1983
  – Secretariat in Boston, 1983-1994

• Co-sponsored by FAO since 1994
  – Secretariat in Boston and NZ, 1994-1998

• FAO/UNU INFOODS formalized by MoU
  – Secretariat in Rome since Jan 1999
Functions of the Secretariat

- Establish a network of regional data centers
- Organise an administrative framework for various expert task forces and standards’ development
- Serve as a generator of and repository for special international data bases
- Stimulate national data base programs
- Support capacity building
18 INFOODS Regional and Subregional Data Centres
A major goal of INFOODS...

The development standards for compiling and interchanging food composition data; increasing the evidence-base:

- Nomenclature, terminology, descriptor systems
- Component identification
- International interchange
1996-2005

Middle East, 2006; Mali, 2005; Tanzania, 2007
Assistance to developing countries

- Training
  - Laboratory qa/qc, accreditation
  - Analytical techniques
  - Food comp courses
- Technical cooperation projects
  - Equipment
  - Sampling/analysis
  - Data compilation/dissemination
Background to INFOODS

Reliable data on the nutrient composition of foods consumed by people are critical in many areas - health assessment, the formulation of appropriate institutional and therapeutic diets, nutrition education, food and nutrition training, epidemiological research on relationships between diet and disease, plant breeding, nutrition labeling, food regulations, consumer protection, and agricultural goods and products, as well as for a variety of applications in trade, research, development, and assistance.

International Network of Food Data Systems (INFOODS) was established in 1984 on the basis of the recommendations of an international group convened under the auspices of the United Nations University (UNU). Its goal was to stimulate and coordinate efforts to improve the quality and availability of food analysis data worldwide and to ensure that anyone anywhere would be able to obtain adequate and reliable food composition data. In furtherance of these purposes INFOODS has provided leadership and administrative framework for the development of standards and guidelines for collection, compilation, and reporting of food component data. It is establishing and coordinating a global network of regional data centers directed toward the generation, compilation and dissemination of accurate and complete data on food composition. It is also the generator and repository of special international data bases and serves as a general and specific resource for persons and organizations interested in food composition data on a worldwide basis. Its Secretariat has developed the necessary software for the electronic storage of food composition data and its interchange among data bases. The INFOODS effort is intrinsically interdisciplinary, depending on the efforts of food scientists, analytical chemists, and nutritionists working together with computer and information scientists.
Over the years, INFOODS has convened technical meetings on several topics, the most important of which are listed with the headings below. These web pages provide links to relevant technical documents by INFOODS and other food composition groups. New efforts are starting to consolidate and update the technical recommendations and specifications. Feedback, suggestions, and additional links would be most welcomed.

- Food Nomenclature, Terminology and Classification Systems
- Food Component Identifiers
- International Interchange of Food Composition Data

Ontologies

- INFOODS tagnames
- USDA Codes
- CAS numbers
- Chemical formulas
- Methods of analysis
Disease
- Communicable
- Non-communicable

Malnutrition
- Undernutrition
- Overnutrition

Double burdens
Evidence
6. Convincing
7. Probable
8. Possible
9. Insufficient

AGRICULTURE & HEALTH

Food composition data form the basis by which intakes, and hence diet-disease relationships, are assessed.

Food composition data are the fundamental information by which dietary intake goals can be established and achieved.

Without sufficient quantity and quality of compositional data—past, present and future—all diet/disease evidence would be insufficient.

The body of data used can and should be world-wide.
Biodiversity

- Sample for varieties
- Generate analytical data for varieties
- Compile these data systematically and centrally
- Collect diet survey data on varieties
- Consider nutrient content in crop variety promotions
Issues for Environment Sector

➢ Agro-biodiversity
➢ Endangered species
➢ Ozone depletion
➢ Global warming
➢ LMOs
➢ Sustainability and global food security
Millennium Development Goals

Goal 1. Eradicate extreme poverty and hunger
  - Reduce by half the proportion of people who suffer from hunger

Goal 7. Ensure environmental sustainability
Cross-cutting initiative on nutrition and biodiversity

- Substantiating and promoting awareness of the links between biodiversity, food and nutrition
- Compilation, review and analysis of existing scientific information, indigenous and traditional knowledge (in a manner consistent with the CBD, Article 8(j)), and case studies;
- Development of a communication strategy, and associated publications and other materials to address: the general public (including the promotion of local varieties, crops and food products in the popular media); decision makers; local communities; and the nutrition, agriculture, health and environment communities;
- Convening of regional advocacy and policy workshops.
Biodiversity & Nutrition Rationale

• Wild species and intraspecies biodiversity have key roles in global food security
• Different varieties have statistically different nutrient contents
• Acquiring nutrient data on existing biodiversity needs to be a prerequisite for decision-making in GMO work
• Nutrient content needs to be among criteria in cultivar promotion
• Sample and generate nutrient data for wild foods and cultivars
• Compile these data systematically and centrally and disseminate widely
• Include biodiversity questions and/or prompts in food consumption surveys
• Acquiring nutrient data and intake data for varieties is essential in order to understand the impact of biodiversity on food security
Sweet potato varieties: α - and β-carotene, mg/100g fresh wt

n=6, values in parentheses are standard errors. # Varieties are recommended by the University of Hawaii Extension Service for good yield and disease resistance. Source: A. S. Huang, L. Tanudjaja, D. Lum. Journal of Food Composition and Analysis, Vol. 12, No. 2, Jun 1999, pp. 147-151.
Issues for Trade: Regulation & Legislation

- World Trade Organization
- Codex Alimentarius
- Regional agreements (CER, EU)
- Major export markets (NLEA, OASIS)
- National standards/regulations
  - Labelling, claims, GMOs, compositional definitions, etc.
Codex Committees

1. Food Additives & Contaminants (38th)
2. Food Labelling (34th)
3. Methods of Analysis & Sampling (27th)
5. Pesticide Residues (39th)
What is a nutrient?

Historic: Components of food that cannot be made by the body, but are required for normal growth and development; the lack of which causes organ system or cell dysfunction that can be reversed upon reintroduction into the diet.
What is a nutrient?

• "It is a fully characterized (physical, chemical, physiological) constituent of a diet, natural or designed, that serves as a significant energy yielding substrate, or a precursor for the synthesis of macromolecules or of other components needed for normal cell differentiation, growth, renewal, repair, defence and/or maintenance or a required signaling molecule, cofactor or determinant of normal molecular structure/function and/or a promoter of cell and organ integrity."

What is a nutrient?

1. Defining the Food-Drug Continuum
   - Food-Drug-Toxicant Continuum
2. Lutein, lycopene, β-cryptoxanthin
3. Phytate, oxalates, tannins
4. Caffeine, salicylates
Furthermore…

“…the definition does not allude to the concept of nutrient essentiality,” and

“…can be harmful”

Technical workshops

1. A Model for Establishing Upper Levels of Intake for Nutrients and Related Substances
   - 2-6 May 2005

2. Principles and Methods for the Risk Assessment of Chemicals in Food
   - Report of Joint FAO/WHO Technical Workshop to develop the guidance on exposure/intake assessment
   - 2-6 May 2005
   - http://www.who.int/ipcs/en/
The consultation

1. Recognise the continuum for components
2. Develop a process
3. Use the risk assessment framework
4. Estimating the distribution of usual nutrient exposures in populations
   - Food, water, supplements
   - Form of the nutrient
   - Population subgroup
   - Time frame
Food composition and dietary intakes

1. Nutrients are toxicants, and nutrient intakes are exposures
2. Foods are nutrients & contaminants, and more
3. A dietary assessment is a risk assessment
4. A food composition database is a supplement database, an additive database, a contaminant database, and a nutrient database

Perspective, Issue 27, ERMA, Nov 2005
Conclusions

1. Food composition data are fundamental for establishing diet/disease relationships;
2. databases should include all ingestants: water, supplements, etc.
3. generate and compile high quality compositional data (nutrient and contaminants) using international standards
4. increase collaboration between agriculture, environment, food safety and nutrition;
5. multiple goals: assessing nutrient adequacy, better understanding risk, establishing nutrient requirements, UL, MRL;
6. establish a network of compatible databases; share the data.
